Module E

PRINCIPLES AND PRACTICES OF ASEPSIS

Statewide Program for Infection Control and Epidemiology (SPICE)
UNC School of Medicine

OBJECTIVES

• Describe the principles and practice of asepsis
• Understand the role of hand hygiene in asepsis
• Understand the role of the environment in disease transmission

DEFINING ASEPSIS

<table>
<thead>
<tr>
<th></th>
<th>Medical Asepsis</th>
<th>Surgical Asepsis</th>

<tbody>
<tr>
<td>Definition</td>
<td>Clean Technique</td>
<td>Sterile Technique</td>
</tr>
<tr>
<td>Emphasis</td>
<td>Freedom from most pathogenic organisms</td>
<td>Freedom from all pathogenic organisms</td>
</tr>
<tr>
<td>Purpose</td>
<td>Reduce transmission of pathogenic organisms from one patient-to-another</td>
<td>Prevent introduction of any organism into an open wound or sterile body cavity</td>
</tr>
</tbody>
</table>

(Free from disease producing microorganisms)
MEDICAL ASEPSIS

Medical asepsis, also known as “clean technique” is aimed at controlling the number of microorganisms and is used for all clinical patient care activities.

Necessary components of medical asepsis include:

- Knowing what is dirty versus clean versus sterile
- How to keep the first three conditions separate
- How to remedy contamination immediately

PRINCIPALS OF MEDICAL ASEPSIS

SURGICAL ASEPSIS
SURGICAL ASEPSIS
Surgical asepsis, also known as “sterile technique” is aimed at removing all microorganisms and is used for all surgical/sterile procedures.

Necessary components of surgical asepsis include:
• Knowing what is and what is not sterile
• How to keep the first two conditions separate
• How to remedy contamination immediately

PRINCIPLES OF SURGICAL ASEPSIS
• The patient should not be the source of contamination
• Healthcare personnel should not be the source of contamination
• The hand scrub should be done meticulously
• Recognize potential environmental contamination
  • Keep door closed
  • Keep traffic to a minimum

KNOWLEDGE CHECK

Which of the following is True?
1. Surgical asepsis should be used for all patient care activities
2. "Clean technique” is used for all procedures done in ambulatory care
3. Clean and dirty equipment can be stored together as long as they are not touching
4. The goal for medical asepsis is freedom from all pathogenic organisms
ROLE OF HAND HYGIENE

WHAT IS HAND HYGIENE?

• Handwashing with soap and water
• Antiseptic handwash
• Alcohol-based hand rub
• Surgical antisepsis

THE ROLE OF HAND HYGIENE

Stratum Cornes of the Skin

Acne infective Erythema

Cuticle

Residual Bacteria

Tea-leaves Bacteria
THE ROLE OF HAND HYGIENE

5 ELEMENTS OF TRANSMISSION

1. Present on the skin or nearby objects
2. Transferred to healthcare workers' hands
3. Survives for several minutes
4. Direct contact with patients or equipment

REASONS FOR NONCOMPLIANCE

- Inaccessible hand hygiene supplies
- Skin irritation
- Too busy
- Glove use
- Didn’t think about it
- Lacked knowledge

34 STUDIES: 1981-2000
- Mean baseline rates: 5%-81%
- Overall average: < 40%

Compliance
POTENTIAL ADVANTAGES
ALCOHOL-BASED HANDRUBS

• Requires less time than hand washing
• Acts quickly to kill microorganisms on hands
• More effective than hand washing with soap and water
• More accessible than sinks
• Less irritating to skin than soap and water and can even improve condition of skin

WHEN TO PERFORM HAND HYGIENE

1. Before touching a patient
   • Before and after touching the patient

2. Before clean / aseptic procedure
   • Before donning sterile gloves for central venous catheter insertion; also for insertion of other invasive devices that do not require a surgical procedure using sterile gloves
   • Before moving from a contaminated body site to another body site during care of the same patient

3. After body fluid exposure risk
   • After contact with body fluids or mucous membranes, non-intact skin or wound dressing
   • After moving from a contaminated body site to another body site during care of the same patient
   • After removing gloves

4. After touching a patient
   • Before and after touching the patient
   • After removing gloves

5. After touching patient surroundings
   • After contact with inanimate surfaces and objects (including medical equipment) in the immediate vicinity of the patient
   • After removing gloves

HOW TO HAND RUB

Video Clip: To start video click on image.
HOW TO HAND RUB

• The use of an alcohol based hand rub is preferential to hand washing when hands are not visible soiled:

HOW TO HAND WASH

Video Clip: To start video click on image.

• Hand washing with soap and water should be used when hands are visible soiled or contaminated with blood and/or body fluids and after providing care for patients with diarrhea:
HAND HYGIENE PROGRAM
ADDITIONAL ELEMENTS
CDC GUIDELINE FOR HAND HYGIENE IN HEALTHCARE SETTING

• Involve staff in evaluation and selection of hand hygiene products
• Provide employees with hand lotions/creams compatible with soap and/or ABHRs
• Do not wear artificial nails when providing direct clinical care
• Provide hand hygiene education to staff
• Monitor staff adherence to recommended HH practices

SUMMARY OF HAND HYGIENE

Hand hygiene must be performed exactly where you are delivering healthcare to patients (at the point-of-care).

During healthcare delivery, there are 5 moments (indications) when it is essential that you perform hand hygiene.

To clean your hands, you should prefer hand rubbing with an alcohol-based formulation, if available. Why? Because it makes hand hygiene possible right at the point-of-care, it is faster, more effective, and better tolerated.

You should wash your hands with soap and water when visibly soiled.

You must perform hand hygiene using the appropriate technique and time duration.

KNOWLEDGE CHECK

True or False:
Hand washing with soap and water is always the preferred method of hand hygiene

True

False
ROLE OF THE ENVIRONMENT

Spaulding Classification of Surfaces:

1. **Critical** – Objects which enter normally sterile tissue or the vascular system and require sterilization

2. **Semi-Critical** – Objects that contact mucous membranes or non-intact skin and require high-level disinfection

3. **Non-Critical** – Objects that contact intact skin but not mucous membranes, and require low or intermediate-level disinfection

---

**Clinical**
- High potential for direct contamination
- Spray or splatter
- Frequent contact with healthcare personnel’s hands

**Housekeeping**
- No direct contact with patients or devices
- Little risk of transmitting infections

---

**ROLE OF THE ENVIRONMENT**

Survival of Pathogens
ROLE OF THE ENVIRONMENT

SELECT, MIX, AND USE DISINFECTANTS CORRECTLY

- Right product
- Right preparation and dilution
- Right application method
- Right contact time
- Wear appropriate PPE (gloves, gown, mask, eye protection)

ROOM CLEANING

Video Clip: To start video click on image

- When cleaning a room that has been occupied by a patient, it is important to use the correct procedure:
  - Clean/disinfect surfaces moving from clean to dirty
  - Prevent contamination of solutions (do not re-dip a cloth or wipe)
  - Do no use wipes that are dried out
  - Elbow grease or physical removal
  - Follow manufacturer’s instructions for use and contact time
  - Monitor cleaning and disinfection process and report findings to staff
KNOWLEDGE CHECK

True or False:
Because of the increasing number of resistant organisms all environmental surfaces should be disinfected with bleach

True  False

KNOWLEDGE CHECK

• Which of the following is NOT a component of asepsis
  1. Hand hygiene
  2. Environmental cleaning
  3. Droplet Precautions
  4. Separation of clean, dirty and sterile items
