URINARY TRACT INFECTIONS IN THE ELDERLY

Chrissy Kistler, MD, MASc
Department of Family Medicine

With thanks to Karen Hoffmann, RN, MS, CIC, FSHEA, FAPIC for use of her slides
DISCLAIMER

The views and opinions expressed in this lecture are those of this speaker and do not reflect the official policy or position of any agency of the U.S. government.
OBJECTIVES

▶ UTIs:
  ▶ Be empowered to prevent UTIs
  ▶ Differentiate between asymptomatic bacteriuria and UTI
  ▶ Identify key findings of a UTI in the elderly
  ▶ Weigh treatment options for UTI

▶ CAUTIs:
  ▶ Be empowered to prevent CAUTIs
  ▶ Understand risks associated with use of Indwelling Urinary (foley) catheters
  ▶ Attain comfort with various catheterization techniques
  ▶ Weigh treatment options for CAUTIs
BACKGROUND
UTI EPIDEMIOLOGY IN NURSING HOMES

- Primary cause of bacteremia in LTC residents is due to UTIs
- Incidence of symptomatic UTIs in elderly in LTC around 10%
- Prevalence of asymptomatic bacteriuria in women approx. 30-70% and 10% in men.
- Public reporting of catheter use rates in nursing homes over the past 15 years has driven down catheter use markedly...national prevalence of indwelling catheter use in nursing home 5-8% with about `13% of new admissions.

ENVIRONMENTAL RISK FACTORS FOR UTI IN THE ELDERLY

Environmental Risk Factors

- Indwelling urinary catheters
- Congregate living
- Mechanical/chemical restraints
- Increased exposure to antibiotics
- Poor infection control techniques

The more impaired or frail the greater the risk of UTI and asymptomatic bacteriuria!!
Physiologic changes of bladder with aging:

Women: Elevation of vaginal pH due to estrogen deficiency

- results in increased ability of bacteria to adhere to the mucosal cells of the bladder.

Men: Decreased bactericidal activity of prostatic secretions

- Increased post-void residual volume of urine
  - Cystocele/rectocele
  - Prostate hypertrophy
  - Neurogenic bladder from comorbidity
PHYSIOLOGIC RISK FACTORS FOR UTIS IN THE ELDERLY (2)

Functional / Cognitive Impairment

- Decrease self care
- Decrease cues to void
- Increased incontinence and perineal soiling
- Difficulty finding bathroom / suitable location to void
MECHANISMS OF COLONIZATION

- Colonic and perineal flora primary source
- Extra-luminal—women – shorter urethra
- Manipulation of the collection system
- From hands of personnel during insertion
- Ascending from drainage bag/junction
HOW COLONIZATION OCCURS

- Microbes produce Biofilm on the catheter surface
- Biofilm is a defense strategy for microbes
- Protects microbes from body’s defenses and antimicrobials!
UTIs
OBJECTIVES

► UTIs:
  ► Be empowered to prevent UTIs
  ► Differentiate between asymptomatic bacteriuria and UTI
  ► Identify key findings of a UTI in the elderly
  ► Weigh treatment options for UTI

► CAUTIs:
  ► Be empowered to prevent CAUTIs
  ► Understand risks associated with use of Indwelling Urinary (foley) catheters
  ► Attain comfort with various catheterization techniques
  ► Weigh treatment options for CAUTIs
PREVENTION OF UTIs (and CAUTIs)

- Hand Hygiene – both residents and staff
- Adequate hydration – 30cc/kg of body weight/day
- Perineal hygiene after toileting
- Routine toileting
- *Removing urinary catheter as early as possible.*
PROPHYLAXIS FOR UTI PREVENTION

- Cranberry juice/extract – currently not enough evidence to recommend for or against use. Cochrane guidelines found no strong evidence for recommending use in prophylaxis (2012).

- Oral Estrogens **not** shown to be beneficial.
- Topical, vaginally applied estrogens have been shown to be effective in smaller studies (sample was post-menopausal).
STUDY FINDS LITTLE CONSISTENCY FOR UTI PREVENTION IN NURSING HOMES (1)

Center for Health Policy at Columbia University School of Nursing surveyed nursing homes across the U.S. in 2014. 955 nursing homes with 88,135 residents were linked to CMS infection data.

- 5.4%+ of 4,700 nursing home residents—suffered a UTI every month.
- Residents with a catheter were 4X more likely to get a UTI than no catheter.
- However, more infections were not associated with catheter use than those that were.

Examined 9 UTI prevention policies and found the following nursing homes policies were associated with lower infection prevalence:

- Policy for portable bladder ultrasound scanners were 10% less likely to have high rates of UTIs that were not associated with catheter use. Only 22% of surveyed facilities had this policy.

- Policy for cleaning the urine collection bag attached to the resident's leg were 20% less likely to have high rates of catheter-associated UTIs. Only 44% of surveyed facilities had this policy.

- If Infection preventionist (IP) on staff who took a national course through APIC were 20% less likely to have high rates of UTIs. Only 9% of respondents had taken an APIC training course.

Ref. Stone et al.
 Toolkit to help staff understand — and effectively and consistently use — proven infection-prevention practices and usage best practices.

Results: CAUTIS fell 54% in 404 nursing homes in 38 states; 6.4 to 3.33 CAUTIs per 1,000 catheter-days.

75% of nursing homes had 40% decrease — even as usage rates held steady (about 4.5 percent of patients in the nursing homes used catheters);

Number of lab tests clinicians ordered to check patients for infections decreased 15%.

Lona Mody, MD, MSc., JAMA Internal Medicine
Monthly content training and coaching calls by project team. Behavior staff training for catheter indications, catheter maintenance, laboratory testing indications, antibiotics, communication strategies.

Urine lab cultures were performed 3.52 times for every 1,000 patient days at the start of the project but went down to 3.09 per 1,000 - preventing false-positives.

Instead of relying on urine culture results, staff received education to help them recognize the early symptoms of a UTI, including in people with dementia who cannot always communicate that they are experiencing pain or burning during urination.
UNC UTI PREVENTION VIDEO

- From the Nursing Home Infection Prevention Courses by The University of North Carolina at Chapel Hill develop by SPICE.
- Infection Prevention in Nursing Homes Video for staff training.
CDC NHSN UTI DEFINITIONS

- Urinary Tract Infection (UTI) aka Acute Uncomplicated Cystitis – infection of the bladder (lower urinary tract).

- Pyelonephritis – infection of the upper urinary tract (ureters / renal collecting system / kidneys)

- “Mixed flora” is not considered an organism and cannot be reported.

- Yeast **cannot** be reported as an organism for a UTI. Urine culture with yeast can be included only if there is at least one qualifying bacterium.
CMS MDS UTI CODING CRITERIA
REVISED OCTOBER 2017

- Item I2300 Urinary tract infection (UTI):
- The UTI has a look-back period of 30 days for active disease instead of 7 days.
- **Code only if both of the following are met in the last 30 days:**
  - It was determined that the resident had a UTI using evidence-based criteria such as McGeer, NHSN, or Loeb in the last 30 days,
  - **AND**
  - A physician documented UTI diagnosis (or by a nurse practitioner, physician assistant, or clinical nurse specialist if allowable under state licensure laws) in the last 30 days.

DIAGNOSTIC DILEMMAS FOR OLDER ADULTS WITH UTI

- Many of the common symptoms (urgency, frequency, incontinence, confusion, falls) occur frequently in this age group.
- Atypical presenting symptoms may be heralding another illness.
- Older adults often have a blunted febrile response.
- Difficulty in obtaining a good history.
Is This Evidence-Based Practice?
IS CLOUDY OR SMELLY URINE A REASON TO GIVE ANTIBIOTICS?

Nurses

Geriatricians

WHAT CAUSES CHANGES IN URINE COLOR OR ODOR?

• Diet
• Medications
• Dehydration
• Bacteria in urine
  • If person is not sick, it’s asymptomatic bacteriuria
HOW COMMON IS ASYMPTOMATIC BACTERIURIA?

- Diabetic Adults: Up to 30%
- Community Elderly: Up to 50%
- LTC Elderly: Nearly 100%
- Indwelling Catheter: Nearly 100%
General Guidelines For Urine Testing

Are any of the following present?
- Fever (at or above 99°F or 1.2°F over baseline) *without other cause*
- Painful urination
- Blood in urine
- Pain/tenderness along urinary tract
- New/increased frequency or urgency

Yes
- Notify health provider
- Send urine for testing

No
- Monitor/Assess
- Nursing interventions

If condition worsens or doesn’t improve
EVALUATION OF POSSIBLE UTI

- Vital signs are essential!
- Fever is the key in decision to treat!
- History and examination to rule out other causes of atypical symptoms.
- U/A and C&S **BEFORE** starting antibiotics
- Clean catch vs I&O catheterization.

HEMATURIA

- Not common with UTIs in older adults.
- Frank hematuria should be evaluated promptly!
- Causes includes stones, cancer, trauma, *infection* and hemorrhage.
SPECIMEN COLLECTION

CDC recommends:

- Obtain urine samples aseptically. (Category IB)
  - If a small volume of fresh urine is needed for examination (i.e., urinalysis or culture), aspirate the urine from the needleless sampling port with a sterile syringe/cannula adapter after cleansing the port with a disinfectant. (Category IB)
  - Obtain large volumes of urine for special analyses (not culture) aseptically from the drainage bag. (Category IB)

- [https://www.cdc.gov/hicpac/cauti/02_cauti2009_abbrev.html](https://www.cdc.gov/hicpac/cauti/02_cauti2009_abbrev.html)
DIPSTICK URINALYSIS

- Leukocyte esterase positive (pyuria)
- Nitrites: positive (bacteriuria)
- Protein: small amount may be present
- Blood: small amount may be present

Leukocyte positive: 50–75% specific; 80-90% sensitive

Pyuria alone not an indication for treatment.
URINE CULTURE

- Gold STANDARD to guide appropriate treatment
- Results: >100,000 colonies of one species
- Treatment can be delayed until cultures results available.
- Positive culture (bacteriuria) alone **not** a reason to treat.
MICROBIOLOGY OF UTI

- 80% are caused by gram negative bacilli
  - E.coli, Klebsiella, Enterobacter, Proteus, and Serratia
  - Gram positive bacilli - Staphylococcus
TREATMENT / NO TREATMENT

- Asymptomatic bacteriuria should NOT be treated.
- Routine or post-treatment screening for bacteriuria is not recommended. (Infectious Diseases Society of America)
  - No benefits in decreasing rates of subsequent UTIs
  - Increased risk of resistance and uropathogens
CMS DNH §483.25(e)(2)(i)
Minimum criteria for initiating antibiotics for an indication of urinary tract infection were considered for residents with no indwelling urinary catheters and for residents with chronic indwelling catheters.

1. NO indwelling catheter, include: acute dysuria alone or fever (>37.9ºC [100ºF] or 1.5ºC [2.4ºF] increase above baseline temperature) and at least one of the following:
   ➢ new or worsening urgency, frequency, suprapubic pain, gross hematuria, costovertebral angle tenderness, or urinary incontinence.

2. Chronic indwelling catheter (indwelling Foley catheter or a suprapubic catheter), includes the presence of at least one of the following:
   ➢ fever (>37.9ºC [100ºF] or 1.5ºC [2.4ºF] increase above baseline temperature),
   ➢ new costovertebral tenderness, rigors (shaking chills) with or without identified cause, or new onset of delirium.”

Provides toolkits to help nursing homes optimize their use of antibiotics.

<th>CHOOSE POTENTIAL INFECTION (CHOOSE ONE):</th>
</tr>
</thead>
<tbody>
<tr>
<td>Urinary Tract Infection</td>
</tr>
<tr>
<td>Skin and Soft Tissue Infection</td>
</tr>
<tr>
<td>Lower Respiratory Tract Infection</td>
</tr>
</tbody>
</table>

**Does the resident have:**

- No indwelling catheter
- Indwelling catheter

**Notes:**

1. Urine cultures should not be performed on a scheduled basis (e.g., monthly).
2. Urine cultures should not be used to identify UTIs in the absence of symptoms.
3. Smelly or cloudy urine is not a symptom of a UTI.
4. Residents with an intermittent catheter or a condom catheter should be evaluated as if they are not catheterized.
5. Urine cultures should be used to identify the most appropriate antibiotic. For residents with acute dysuria, it may be appropriate to initiate empirical antibiotic therapy, but for all other symptoms, wait for a urine culture.
6. For residents who regularly run a lower temperature, use a temperature of 2°F (1°C) above the baseline as a definition of a fever.

**Does the resident have acute dysuria?**

- Yes
- No

Minimum criteria for initiating antibiotics are MET.

### Assessment Input (check all boxes that apply)

#### Resident WITH indwelling catheter
- The criteria are met to initiate antibiotics if one of the below are selected:

<table>
<thead>
<tr>
<th>No</th>
<th>Yes</th>
</tr>
</thead>
<tbody>
<tr>
<td>☐</td>
<td>☐</td>
</tr>
<tr>
<td>☐</td>
<td>☐</td>
</tr>
<tr>
<td>☐</td>
<td>☐</td>
</tr>
<tr>
<td>☐</td>
<td>☐</td>
</tr>
<tr>
<td>☐</td>
<td>☐</td>
</tr>
<tr>
<td>☐</td>
<td>☐</td>
</tr>
</tbody>
</table>

#### Resident WITHOUT indwelling catheter
- Criteria are met if one of the three situations are met:

<table>
<thead>
<tr>
<th>No</th>
<th>Yes</th>
</tr>
</thead>
<tbody>
<tr>
<td>☐</td>
<td>☐</td>
</tr>
<tr>
<td>☐</td>
<td>☐</td>
</tr>
<tr>
<td>☐</td>
<td>☐</td>
</tr>
<tr>
<td>☐</td>
<td>☐</td>
</tr>
<tr>
<td>☐</td>
<td>☐</td>
</tr>
<tr>
<td>☐</td>
<td>☐</td>
</tr>
</tbody>
</table>

---

### Nursing: Please check box to indicate whether or not criteria are met

- ☐ **Nursing home protocol criteria are met.** Resident may require UA with C&S or an antibiotic.†
- ☐ **Nursing home protocol criteria are NOT met.** The resident does NOT need an immediate prescription for an antibiotic, but may need additional observation.‡‡

### Request for Physician/NP/PA Orders

Orders were provided by clinician through ☐ Phone ☐ Fax ☐ In Person ☐ Other ____________
- ☐ Order UA
- ☐ Urine culture
UTI CONCLUSIONS

- Use a structured evaluation and know prescribing criteria: SBAR, etc.
- Watchful waiting and periodic re-evaluation (once cultures result): de-prescribe
- Know the evidence-based signs and symptoms of infections: Fever is 1.2°F above baseline (usually around 99°F - 99.5°F)
- Consider all possible diagnoses and treatments
- Use first line agents: TMP/SMX, Nitrofurantoin, Fosfomycin, or pivmecillinam (and NOT fluoroquinolones)
- Only prescribe for 3-5 days

OBJECTIVES

▲ UTIs:
  ▶ Be empowered to prevent UTIs
  ▶ Differentiate between asymptomatic bacteriuria and UTI
  ▶ Identify key findings of a UTI in the elderly
  ▶ Weigh treatment options for UTI

▲ CAUTIs:
  ▶ Be empowered to prevent CAUTIs
  ▶ Understand risks associated with use of Indwelling Urinary (foley) catheters
  ▶ Attain comfort with various catheterization techniques
  ▶ Weigh treatment options for CAUTIs
CATHETER-ASSOCIATED UTI (CAUTI)
PREVENTION CATHETER-ASSOCIATED UTI (1)

- Catheter used for appropriate indications.
- Urinary catheter duration of use minimized.  
  *Increase of 5% risk per day!*
- Hand hygiene before and after insertion of catheter and during any manipulation.
- Only properly trained persons for insertion using aseptic technique.

CDC HICPAC Guidelines for Prevention of Catheter Associated Urinary Tract Infections 2009
PREVENTION OF CATHETER-ASSOCIATED UTI (2)
CDC HICPAC GUIDELINES FOR PREVENTION OF CATHETER ASSOCIATED URINARY TRACT INFECTIONS 2009

- Catheter properly secured to prevent urethral traction.
- Closed drainage system maintained.
- Unobstructed urine flow maintained.
- Collecting bag emptied regularly; using a separate clean collecting container for each resident.
Clean technique for intermittent catheterization.
Standard Precautions during catheter manipulation.
Periurethral cleaning with antiseptics not recommended. Routine hygiene recommended.
Routine use of antimicrobial/antiseptic-impregnated catheters not recommended.
PREVENTION OF CATHETER-ASSOCIATED UTI(4)
CDC HICPAC GUIDELINES FOR PREVENTION OF CATHETER ASSOCIATED URINARY TRACT INFECTIONS 2009

- No routine schedule for catheter replacement (e.g. monthly)
- If obstruction or infection occurs - change the catheter.
- Urine samples obtained aseptically.

Note: Before urine samples for culture are obtained from resident with a catheter in place > 14 days, catheter should be replaced and specimen obtained from new catheter.
PREVENTION OF CATHETER-ASSOCIATED UTI(5)
CDC HICPAC GUIDELINES FOR PREVENTION OF CATHETER ASSOCIATED URINARY TRACT INFECTIONS 2009

- Quality Improvement Programs – based on facility risk assessment.
- QI Program should: assure utilization, daily need review, adherence to hand hygiene, care of catheters.
  - system of reminders of residents with catheters
  - guidelines and protocols for nurse-directed removal of unnecessary catheters.
  - Education and performance feedback of staff.
- Administrative Infrastructure – use of evidence based guidelines, monitoring adherence, and education and training, ensuring supplies available and surveillance resources.
RISK FACTORS FOR CAUTI

- Urinary stasis- no below the bladder drainage
- Over-distention and pyelonephritis– kinks with backflow
- Urethral trauma – catheter tugging
- Improper handling of urine collection bag
- Duration of catheter use – biofilm buildup
- 5% risk per day of catherization, >30 days universal asymptomatic bacteriuria
§483.25(d) Urinary Incontinence

Based on the resident’s comprehensive assessment, the facility must ensure that --

§483.25(d) (1) A resident who enters the facility without an indwelling catheter is not catheterized unless the resident’s clinical condition demonstrates that catheterization was necessary; and

§483.25(d) (2) A resident who is incontinent of bladder receives appropriate treatment and services to prevent urinary tract infections and to restore as much normal bladder function as possible.
INDWELLING CATHETER-ASSOCIATED UTI (CAUTI)

▶ Catheter colonization and infection is inevitable and expected!
▶ Once bacteria colonizes urine, concentration is 100,000 colonies within 72 hours!!
Intermittent catheterization can often manage overflow incontinence effectively.

New onset incontinence from a transient, hypotonic/atonic bladder (usually seen following indwelling catheterization in the hospital) may benefit from intermittent bladder catheterization until the bladder tone returns (e.g., up to approximately 7 days).

A voiding trial and post void residual can help identify when bladder tone has returned.
APPROPRIATE USE OF URINARY CATHETERS

- Clinical criteria for long/short for indwelling catheter:
  - Obstruction
  - Neurogenic bladder
  - Hematuria (short term)
  - Wounds stage 3 or >
  - Aggressive diuresis / monitoring of strict I/O (short term)
  - Terminally ill for comfort measures

- Develop policies for independent nursing removal and education on technique for placement and management of device and collecting bag

INAPPROPRIATE USE OF URINARY CATHETERS

- Used for the convenience of nursing staff.
- Used in lieu of other bladder management strategies.
- Used for specimen collection when the resident can voluntarily void
- Catheter left in place when removal is indicated.

(Indwelling catheters are associated with a 5% risk/day)

CDCC HICPAC Guidelines for Prevention of Catheter Associated Urinary Tract Infections 2009
ROUTES OF ENTRY OF UROPATHOGENS TO CATHERETERIZED URINARY TRACT

Extraluminal
- Early, at insertion
- Late, by capillary action

Intraluminal
- Break in closed drainage
- Contamination of collection bag urine

Source: Maki and Tambyah (2001)
SUMMARY OF UTI/CAUTI

- Prevent Infection –
  - Hand Hygiene – both residents and staff
  - Adequate hydration – 30cc/kg of body weight/day
  - Perineal hygiene after toileting
  - Routine toileting
  - **Removing urinary catheter as early as possible!**
- Colonization (the positive culture) should NOT be treated. **USE SYMPTOMS AND SIGNS!**
- Pyuria alone is not enough to make diagnosis of UTI
- Antibiotics should not be used to treat asymptomatic UTIs in LTCFs.
- Do not culture after completing antibiotic course.
