

## **Definitions and Surveillance for Healthcare Associated Infections (HAIs) in Long-term Care**

Angela Warren, RN, BSN, MS, CIC  
SPICE Infection Prevention  
Consultant

1

**How confident are you that your facility has a  
strong infection prevention program that  
includes all the necessary elements?**

- A. Completely confident
- B. Somewhat confident
- C. Not confident
- D. Have NO idea

2

**Do you believe you have the skills and the qualifications to oversee the infection prevention program?**

- A. Yes
- B. No
- C. No way; No how

SPICE 

3

**If you wanted to compare your IP surveillance data to another NH in your community that cared for a similar resident population, how confident are you that events will be tracked the same way?**

- A. Very confident
- B. Slightly confident
- C. Not confident at all
- D. Not sure if I can compare my own data from one year to the next

SPICE 

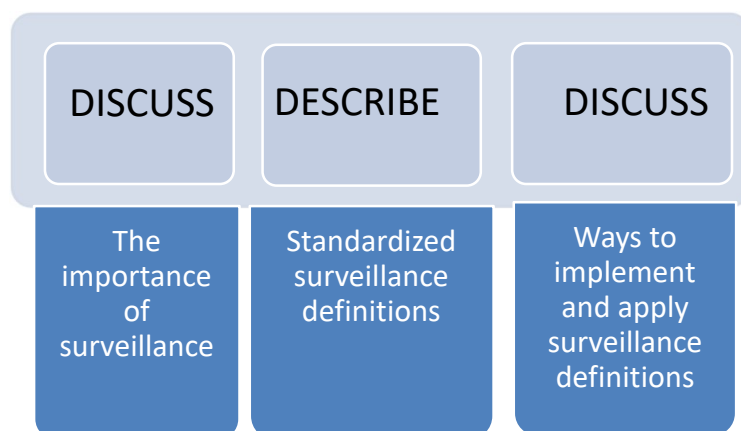

4

## What standardized definition does your facility use for surveillance?

- A. National Healthcare Safety Network (NHSN)
- B. Revised McGeer Definitions
- C. Loeb Criteria
- D. When the physician documents an infection
- E. No standardized criteria
- F. A and B

5

6

- “Surveillance is a comprehensive method of measuring outcomes and related processes of care, analyzing the data, and providing information to members of the healthcare team to assist in improving those outcomes and processes (APIC Text)
- “Surveillance system must include “**routine, ongoing, and systematic collection, analysis, interpretation, and dissemination** of surveillance data to identify infections (i.e., HAI and communicable-acquired), infection risks, communicable disease outbreaks and to maintain or improve resident health status:” (CMS 2/23)

7

## Rationale for Conducting Surveillance

- One of the most important aspects of an IP's responsibilities
- Should cover residents, staff, contractors (in the facility) and visitors
- Include process and outcome measures

*Establish Baseline Data  
Reduce Infection Rates  
Detection of Outbreaks  
Monitor Effectiveness of Interventions  
Education of HCP*

***Required as a Component of Plan***

8

## Types of Surveillance

- Total (or Whole) House Surveillance
- Targeted Surveillance
- Combination Surveillance Strategy

SPICE 

9

## Total (Whole House)

- Monitor:
  - All infections
  - Entire population
  - All units

Pros	Cons
Monitor all infections	Overall rate not sensitive or risk-adjusted
Include entire population	No trends or comparison
	Labor intense and inefficient use of resources
	Not based on risk assessment

SPICE 

10

## Priority Directed (Targeted)

- Focus on:
  - Care units
  - Infections related to devices
  - Invasive procedures
  - Significant organisms – epidemiologically important
  - High-risk, high-volume procedures
  - Infections having known risk reduction methods

SPICE 

11

## Targeted Surveillance

Pros	Cons
Risk-adjusted rates	May miss some infections
Can measure trends and make comparisons	Limited information on endemic rates
More efficient use of resources	
Can target potential problems	
Identify performance improvement opportunities	
Can evaluate effectiveness of prevention activities	

SPICE 

12

## Combination

- Monitor:
  - Targeted events in defined populations and
  - Selected whole-house events
- Pros:
  - Rates are risk-adjusted
  - Measure trends
  - Target potential problems
  - Track selected events house-wide
- Cons:
  - May miss some infections

SPICE 

13

## Selection of Processes and Outcomes

### *Processes*

- Hand hygiene
- Urinary Catheter insertion/maintenance

### *Outcomes*

- Acute respiratory infections
- Urinary tract infections
- Skin/Soft Tissue Infections
- Gastroenteritis

SPICE 

14

## Consideration for Choosing Outcome Measures

- Mandatory/required-Cat 1C
- \*Frequency (incidence) of the infection
- \*Communicability
- \*System/resident cost (↑mortality, hospitalization)
- \*Early Detection

*\*Based on the Infection Prevention risk assessment*

15

Should be  
included in  
routine  
surveillance

Points to Consider	Infections	Comments
Evidence of <u>transmissibility</u> in a healthcare setting	Viral respiratory tract infections, viral GE, and viral conjunctivitis	Associated with outbreaks among residents and HCP in LTCFs
Processes available to prevent acquisition of infection, i.e., HH compliance		
Clinically significant cause of morbidity or mortality	Pneumonia, UTI, GI tract infections, (including <i>C. difficile</i> ) and SSTI	Associated with hospitalization and functional decline in LTCF residents
Specific pathogens causing serious outbreaks	Any invasive group A <i>Streptococcus</i> infection, acute viral hepatitis, norovirus, scabies, influenza-COVID-19, <i>C auris</i>	A single laboratory-confirmed case should prompt further investigation

16

## Infections that could be included in routine surveillance

Points to Consider	Infections	Comments
Infections with limited transmissibility in a healthcare settings	Ear and sinus infections, fungal oral and skin infections and herpetic skin infections	Associated with underlying comorbid conditions and reactivation of endogenous infection
Infections with limited preventability		

17

## Infections for which other accepted definitions should be applied in LTCF surveillance

Points to Consider	Infections	Comments
Infections with other accepted definitions (may apply to only specific at-risk residents)	Surgical site infections, central-line- associated bloodstream infections and ventilator-associated pneumonia	LTCF-specific definitions were not developed. Refer to the National Healthcare Safety Network's criteria

18

## Sources of Data for Surveillance

- Clinical ward/unit rounds
- Medical Chart
- Lab reports
- Kardex/Patient Profile/Temperature logs
- Antibiotic Starts
- IT support

SPICE 

19

## Surveillance

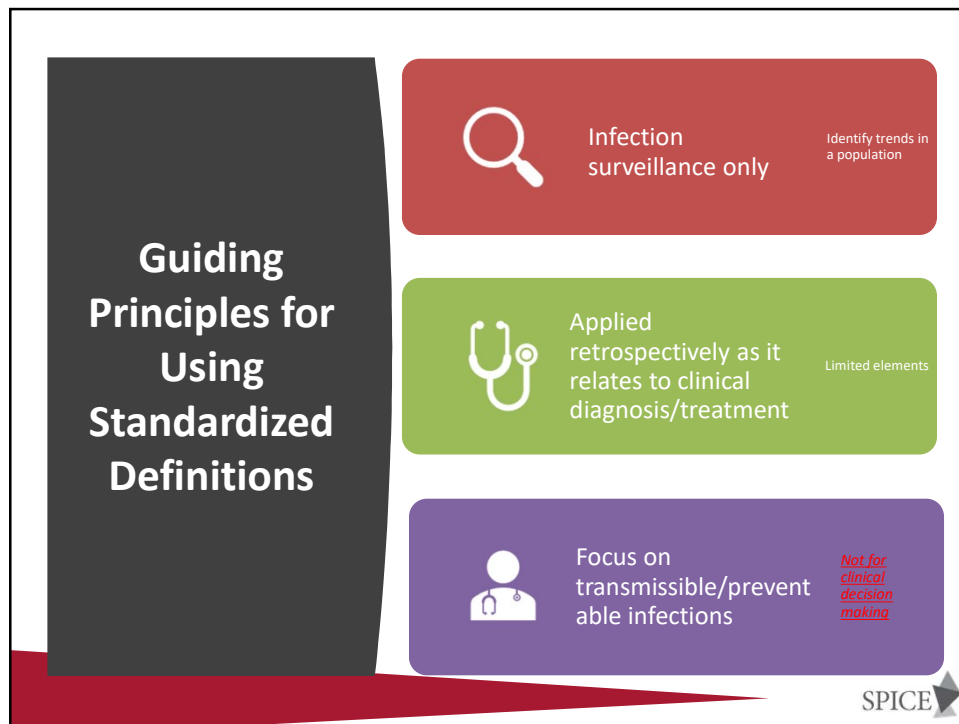

- ***The facility's surveillance system must include a data collection tool and the use of nationally-recognized surveillance criteria such as but not limited to, the CDC's National Healthcare Safety Network (NHSN) Long Term Care Criteria to define infections or revised McGeer criteria***

State Operations Manual  
Appendix PP - Guidance to Surveyors for  
Long Term Care Facilities

Table of Contents  
(Rev. 02-03-2023)

SPICE 

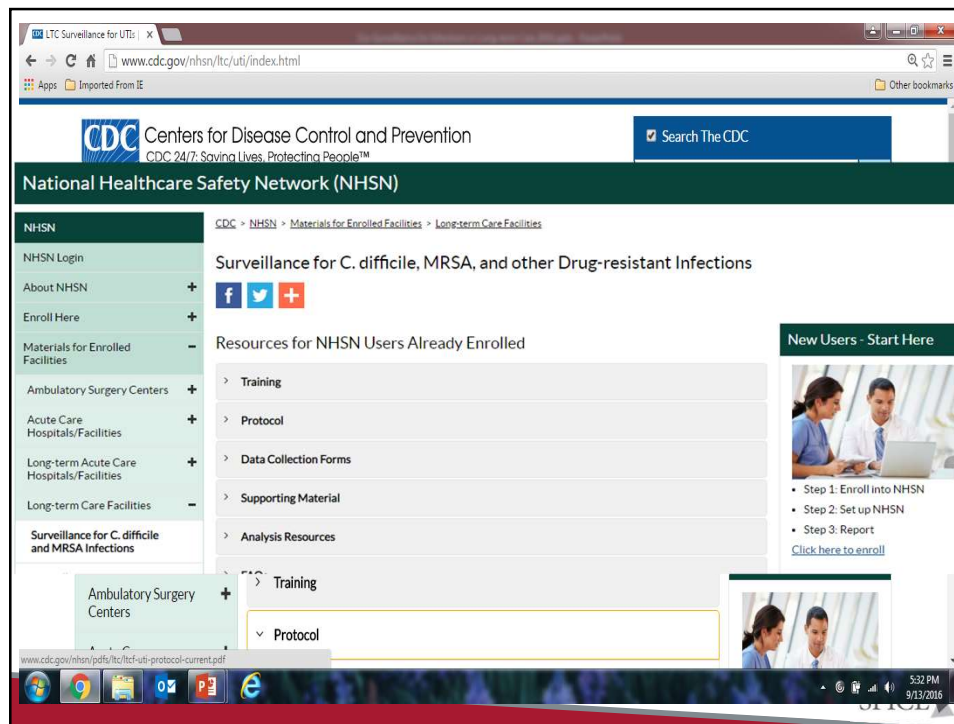

20

21

22

23

## Purposes of NHSN

Provide facilities with risk-adjusted data that can be used for inter-facility comparisons and local quality improvement activities

Assist facilities in developing surveillance and analysis methods that permit timely recognition of patient and healthcare personnel safety problems and prompt intervention with appropriate measures

Conduct collaborative research studies with members

Data repository for reporting healthcare associated infections, COVID-19 infections, COVID vaccinations and certain process measures

24

NC SPICE 4/20/24 rev

NC SPICE 4/20/24 rev

## Attribution of infection to LTCF

- No evidence of an incubating infection at the time of admission to the facility
  - Basis of clinical documentation of appropriate signs and symptoms and not solely on screening microbiologic data
- Onset of clinical manifestation occurs > 2 calendar days after admission.

## Attribution of infection to LTCF

- All symptoms must be new or acutely worse
- Non-infectious causes of signs and symptoms should always be considered prior to diagnosis
- Identification of an infection should not be based on a single piece of evidence
  - Clinical, microbiologic, radiologic
- Diagnosis by physician insufficient (based on definition)

SPICE 

29

## Constitutional Requirements

### Fever:

- A single oral temperature  $>37.8^{\circ}\text{C}$  [ $100^{\circ}\text{F}$ ], OR
- Repeated oral temperatures  $>37.2^{\circ}\text{C}$  [ $99^{\circ}\text{F}$ ]; rectal temperature  $>37.5^{\circ}$  ( $99.5^{\circ}\text{F}$ ) OR
- $>1.1^{\circ}\text{C}$  [ $2^{\circ}\text{F}$ ] over baseline from a temperature taken at any site

SPICE 

30

## Constitutional Requirements

### Leukocytosis

- Neutrophilia > 14000 WBC/mm<sup>3</sup>
- OR
- Left shift (>6% bands or ≥1500 bands/mm<sup>3</sup>)

SPICE 

31

## Constitutional Requirements

### Acute Change in Mental Status from Baseline

- Based on Confusion Assessment Method (CAM) criteria available in MDS

Change	Criteria
Acute Onset	Evidence of acute change in mental status from resident baseline
Fluctuating	Behavior fluctuating (e.g., coming and going or changing in severity during assessment)
Inattention	Resident has difficulty focusing attention (e.g., unable to keep track of discussion or easily distracted)
Disorganized Thinking	Resident's thinking is incoherent (e.g., rambling conversation, unclear flow of ideas)
Altered level of consciousness	Resident's level of consciousness is described as different from baseline (e.g., hyperalert, sleepy, drowsy, difficult arouse, nonresponsive)

Either  
/or

SPICE 

32

## Constitutional Requirements

### Acute Functional Decline

- New 3-point increase in total ADL score (0-28) from baseline based on 7 ADLs {0 = independent; 4 = total dependence}
  1. Bed mobility
  2. Transfer
  3. Locomotion within LTCF
  4. Dressing
  5. Toilet use
  6. Personal hygiene
  7. Eating

33

## Site Specific Definitions

### Knowledge Checks

34

## Respiratory Tract Infections

Criteria	Comments
<p><b>A. <u>Common cold syndrome/pharyngitis</u></b></p> <p>At least <b>two</b> criteria present</p> <ol style="list-style-type: none"> <li>1. Runny nose or sneezing</li> <li>2. Stuffy nose (i.e., congestion)</li> <li>3. Sore throat or hoarseness or difficulty swallowing</li> <li>4. Dry cough</li> <li>5. Swollen or tender glands in neck</li> </ol>	<p>Fever may or may not be present. Symptoms must be new, and not attributable to allergies</p>

35

## Respiratory Tract Infections

Criteria	Comments
<p><b>B. <u>Influenza-like illness</u></b></p> <p><b>Both</b> criteria 1 and 2 present</p> <ol style="list-style-type: none"> <li>1. Fever</li> <li>2. At least <b>three</b> of the following symptom sub-criteria (a-f) present               <ol style="list-style-type: none"> <li>a. Chills</li> <li>b. New headache or eye pain</li> <li>c. Myalgias or body aches</li> <li>d. Malaise or loss of appetite</li> <li>e. Sore throat</li> <li>f. New or increased dry cough</li> </ol> </li> </ol>	<p>If criteria for influenza-like illness and another upper or lower respiratory tract infection are met at the same time, only the diagnosis of influenza-like illness should be used</p> <p>Due to increasing uncertainty surrounding the timing of the start of influenza season, the peak of influenza activity and the length of the season, 'seasonality' is no longer part of the criteria to define influenza-like illness</p>

36

## Respiratory Tract Infections

Criteria	Comments
<b>C. <u>Pneumonia</u></b>	
<b>All criteria 1-3 present</b>	
1. Interpretation of chest radiograph as demonstrating pneumonia or the presence of <u>new</u> infiltrate	For both pneumonia and lower respiratory tract infections, presence of underlying conditions which could mimic a respiratory tract infection presentation (congestive heart failure, interstitial lung disease), should be excluded by review of clinical records and an assessment of presenting symptoms and signs
2. At least <b>one</b> of the following respiratory sub-criteria (a-f) present	
a. New or increased cough	
b. New or increased sputum production	
c. O <sub>2</sub> saturation <94% on room air or a reduction in O <sub>2</sub> saturation of more than 3% from baseline	
d. New or changed lung exam abnormalities	
e. Pleuritic chest pain	
f. Respiratory rate of ≥ 25/min	
3. At least <b>one</b> constitutional criteria	

37

## Respiratory Tract Infections

Criteria	Comments
<b>D. <u>Lower respiratory tract (Bronchitis or Tracheo-bronchitis)</u></b>	
<b>All criteria 1-3 present</b>	
1. Chest radiograph not performed <u>or negative</u> for pneumonia or new infiltrate.	For both pneumonia and lower respiratory tract infections, presence of underlying conditions which could mimic a respiratory tract infection presentation (congestive heart failure, interstitial lung disease), should be excluded by review of clinical records and an assessment of presenting symptoms and signs
2. At least <b>two</b> of the following respiratory sub-criteria (a-f) present	
a. New or increased cough	
b. New or increased sputum production	
c. O <sub>2</sub> saturation <94% on room air or a reduction in O <sub>2</sub> saturation of more than 3% from baseline	
d. New or changed lung exam abnormalities	
e. Pleuritic chest pain	
f. Respiratory rate of ≥ 25/min	
3. At least <b>one</b> constitutional criteria	

38

## Knowledge Check

SPICE

39

## Knowledge Check #1

Mr. Do Little has multiple co-morbidities including hypertension and acute respiratory failure. Vitals on admission WNL

On day seven after admission, the daughter tells the nurse "dad is not responding like he used to. He can not hold a conversation, tires easily and is not able to brush his teeth, eat or dress without assistance." **I think he has a UTI. He needs an antibiotic.**

SPICE

40

## Clinical Picture

**Physical exam:**

- Temp 100.7, pulse 107, RR 26 and O2 sat 93%
- Ronchi noted on auscultation of the chest the resident is confused

**MD notified and orders urine and chest x-ray**

**Results:**

- Culture + E. coli  $10^2$  cfu/ml and
- chest x-ray: no new findings

41

## Does Mr. Do Little have an infection?

- Yes
- No
- Have no idea

42

## What surveillance criteria are met?

- A. Common Cold
- B. Pneumonia
- C. Urinary tract infection
- D. Lower respiratory track

43

## If Yes, is it facility or community associated?

- Facility
- Community

44

## Respiratory Tract Infections

Criteria	Comments
<p><b>D. <u>Lower respiratory tract (Bronchitis or Tracheo-bronchitis)</u></b></p> <p><b>All</b> criteria 1-3 present</p> <ol style="list-style-type: none"> <li>1. Chest radiograph not performed <u>or negative</u> for pneumonia or new infiltrate.</li> <li>2. At least <b>two</b> of the following respiratory sub-criteria (a-f) present               <ol style="list-style-type: none"> <li>a. New or increased cough</li> <li>b. New or increased sputum production</li> <li>c. O<sub>2</sub> saturation &lt;94% on room air or a reduction in O<sub>2</sub> saturation of more than 3% from baseline</li> <li>d. New or changed lung exam abnormalities</li> <li>e. Pleuritic chest pain</li> <li>f. Respiratory rate of ≥ 25/min</li> </ol> </li> <li>3. At least <b>one</b> constitutional criteria</li> </ol>	<p>For both pneumonia and lower respiratory tract infections, presence of underlying conditions which could mimic a respiratory tract infection presentation (congestive heart failure, interstitial lung disease), should be excluded by review of clinical records and an assessment of presenting symptoms and signs</p>

45

## WHAT ABOUT URINARY TRACT INFECTIONS

46

## What do the Guidelines Say?

- Insert catheters only for appropriate indications
- Avoid use of urinary catheters in patients and nursing home residents for management of incontinence
- Keep the catheter and collecting tube free from kinking
- Empty the drainage bag regularly using a separate, clean collecting container for each resident (even in semi-private rooms)
- **Changing indwelling catheters or drainage bags at routine, fixed intervals is not recommended.** It is suggested to change catheters and drainage bags based on clinical indications such as infection, obstruction, or when the closed system has been compromised

<https://www.cdc.gov/infectioncontrol/guidelines/cauti/index.html>

47

## Urinary Specimens: What do the Guidelines Say?

- Specimens collected through the catheter present for more than a few days reflect biofilm microbiology.
- For residents with chronic indwelling catheters (greater than 14 days) and symptomatic infection, changing the catheter immediately prior to instituting antimicrobial therapy allows collection of a bladder specimen, which is a more accurate reflection of infecting organisms.
- Urinary catheters coated with antimicrobial materials have the potential to decrease UTIs but have not been studied in the LTCF setting.

*SHEA/APIC Guideline: Infection prevention and control in the long-term care facility Philip W. Smith, MD, Gail Bennett, RN, MSN, CICb Suzanne Bradley, MD, Paul Drinka, MD, Ebbing Lautenbach, MD, James Marx, RN, MS, CIC, Lona Mody, MD, Lindsay Nicolle, MD and Kurt Stevenson, MD July 2008*

48

McGeer Urinary Tract Infections without catheter		
Criteria	Comments	
<p><b>A. For Residents without an indwelling catheter</b></p> <p>Both criteria 1 and 2 present</p> <p>1. At <b>least one</b> of the following sign/symptom sub-criteria (a-c) present:</p> <div style="border: 1px solid black; padding: 5px; margin: 5px;"> <p>a) Acute dysuria <u>or</u> acute pain, swelling, or tenderness of the testes, epididymis, or prostate</p> </div> <div style="border: 1px solid black; padding: 5px; margin: 5px;"> <p>b) Fever <u>or</u> leukocytosis and</p> <p>At least one of the following localizing urinary tract sub-criteria:</p> <ol style="list-style-type: none"> <li>Acute costovertebral angle pain or tenderness</li> <li>Suprapubic pain</li> <li>Gross hematuria</li> <li>New or marked increase in incontinence</li> <li>New or marked increase in urgency</li> <li>New or marked increase in frequency</li> </ol> </div>	<p>c) In the absence of fever or leukocytosis, then at least two or more of the following localizing urinary symptoms</p> <ol style="list-style-type: none"> <li>Suprapubic pain</li> <li>Gross hematuria</li> <li>New or marked increase in incontinence</li> <li>New or marked increase in urgency</li> <li>New or marked increase in frequency</li> </ol> <p>2. One of the following microbiologic sub-criteria</p> <div style="border: 1px solid red; padding: 5px; margin: 5px;"> <p>a) <u>At least</u> <math>10^5</math> cfu/ml of no more than 2 species of microorganisms in a voided urine</p> <p>b) <u>At least</u> <math>10^2</math> cfu/ml of any number of organisms in a specimen collected by an in and out catheter</p> </div>	<p>UTI should be diagnosed when there are localizing s/s <u>and</u> a positive urinary culture</p> <p><i>A diagnosis of UTI can be made without localizing symptoms if a blood culture isolate of the same organism isolated from the urine and there is no alternate sight of infection</i></p> <p>In the absence of a clear alternate source, fever or rigors with a positive urine culture in a non-catheterized resident will often be treated as a UTI. However, evidence suggest most of these episodes are not from a urinary source</p> <p>Pyuria does not differentiate symptomatic UTI from asymptomatic bacteria</p> <p>Absence of pyuria in diagnostic test excludes symptomatic UTI in residents of LTCF</p> <p>Urine specimens should be processed within 1-2 hours, or refrigerated and processed within 24 hours.</p>

49

McGeer Urinary Tract Infections		
Criteria	Comments	
<p><b>B. For the resident with an indwelling catheter</b></p> <p>Both criteria 1 and 2 present</p> <p>1. At least <b>one</b> of the following sign/symptom sub-criteria (a-d) present:</p> <ol style="list-style-type: none"> <li>Fever, rigors, or new onset hypotension, with no alternate site of infection</li> <li>Either acute change in mental status <u>or</u> acute functional decline with no alternate diagnosis <u>and</u> Leukocytosis</li> <li>New onset suprapubic pain <u>or</u> costovertebral angle pain or tenderness</li> <li>Purulent discharge from around the catheter <u>or</u> acute pain, swelling, or tenderness of the testes, epididymis, or prostate</li> </ol> <p>2. Urinary catheter culture with <b>at least</b> <math>10^5</math> cfu/ml of <b>any</b> organism(s)</p>	<p>Recent catheter trauma, catheter obstruction or new onset hematuria are useful localizing signs consistent with UTI, but not necessary for diagnosis</p> <p>Urinary catheter specimens for culture should be collected following the replacement of the catheter (if current catheter has been in place for &gt;14 days)</p>	

50

51

## NHSN Notes

- Indwelling urinary catheter should be in place for a minimum of 2 calendar days before infection onset (day 1 = day of insertion)
- Indwelling urinary catheter: a drainage tube that is inserted into the urinary bladder through the urethra, is left in place and is connected to a closed collection system, also called a foley catheter. Indwelling urinary catheters do not include straight in-and-out catheters or suprapubic catheters (these would be captures as SUTIs, not CA-SUTIs)
- *Indwelling catheters which have been in place for > 14 days should be changed prior to specimen collection but failure to change catheter does not exclude a UTI for surveillance purposes*

SPICE 

52

## NHSN Key Reminders

1. ***"Mixed flora" is not available in the pathogen list within NHSN.*** Therefore, it cannot be reported as a pathogen to meet the NHSN UTI criteria. Additionally, "mixed flora" often represents contamination and likely represents presence of multiple organisms in culture (specifically, at least two organisms).
2. ***Yeast and other microorganisms, which are not bacteria, are not acceptable UTI pathogens,*** and therefore, cannot be used to meet NHSN UTI criteria without the presence of a qualifying bacterium.
3. To remove the subjectivity about whether a fever is attributable to a UTI event, ***the presence of a fever, even if due to another cause (for example, pneumonia), must still be counted as a criterion when determining if the NHSN UTI definition is met.***

SPICE

53

## NHSN Urinary Tract Infections For Residents without an indwelling catheter

Must meet Criteria 1,2 OR 3		
Criteria 1	Criteria 2	Criteria 3
<p>One of the following true:</p> <ol style="list-style-type: none"> <li>1. Acute dysuria</li> <li>2. Acute pain, swelling or tenderness of the testes, epididymis or prostate</li> </ol> <p><b>AND</b></p> <p>A positive urine culture with no more than 2 species of microorganisms, at least one of which is a bacterium of <math>\geq 10^5</math> CFU/ml</p>	<p>Either of the following:</p> <ol style="list-style-type: none"> <li>1. Fever: (Single temperature <math>&gt;100^\circ</math> F or <math>&gt;99^\circ</math> F on repeated occasions (<b>more than once</b>) OR an increase of <math>&gt;2^\circ</math> F over baseline</li> <li>2. Leukocytosis: <math>&gt;10,000</math> cells/mm<sup>3</sup> or left shift (6% or 1, 500 bands/mm<sup>3</sup>)</li> </ol> <p><b>AND</b></p> <p>One or more of the following (<b>New or Marked increase</b>):</p> <ol style="list-style-type: none"> <li>1. Costovertebral angle pain or tenderness</li> <li>2. Suprapubic tenderness</li> <li>3. Visible (Gross) hematuria</li> <li>4. Incontinence</li> <li>5. Urgency</li> <li>6. Frequency</li> </ol> <p><b>AND</b></p> <p>A positive urine culture with no more than 2 species of microorganisms, at least one of which is a bacterium of <math>\geq 10^5</math> CFU/ml</p>	<p><b>Two or more of the following (New and/or marked increase):</b></p> <ol style="list-style-type: none"> <li>1. Costovertebral angle pain or tenderness</li> <li>2. Incontinence</li> <li>3. Urinary urgency</li> <li>4. Urinary frequency</li> <li>5. Suprapubic tenderness</li> <li>6. Visible (gross) hematuria</li> </ol> <p><b>AND</b></p> <p>A positive urine culture with no more than 2 species of microorganisms, at least one of which is a bacterium of <math>\geq 10^5</math> CFU/ml</p>

**Comments:** Fever can be used to meet SUTI criteria even if the resident has another possible cause for the fever (for example, pneumonia)

54

## NHSN Urinary Tract Infections

*For the resident with an indwelling catheter or removed within 2 calendar days prior to the event onset (day of catheter removal is day 1)*

Criteria	Comments	
<u>CA-SUTI</u>		
<b>One or more</b> of the following (Signs and Symptoms and Laboratory and diagnostic Testing):		
a) *Fever (Single temperature >100° F or >99° F on repeated occasions OR an increase of >2° F over baseline)	<b>AND</b> 	A positive urine culture with no more than 2 species of microorganisms, at least one of which is a bacterium of $\geq 10^5$ CFU/ml
b) Rigors		
c) New onset hypotension, with no alternate noninfectious cause		
d) New onset confusion/functional decline <b>with no alternate diagnosis AND</b> Leukocytosis (>10,000 cells/mm³ or left shift (6% or 1, 500 bands/mm³))		
e) New or marked increase in costovertebral angle pain or tenderness		
f) New or marked increase in suprapubic tenderness		
g) Acute pain, swelling, or tenderness of the testes, epididymis, or prostate		<i>*Fever can be used to meet CA-SUTI criteria even if the resident has another possible cause for the fever (for example, pneumonia)</i>
h) Purulent discharge from around the catheter insertion site		
i) Acute dysuria (used only if catheter removed)		

55

## Asymptomatic Bacteremic Urinary Tract Infection (ABUTI)

*Resident with or without an indwelling urinary catheter:*

1. No qualifying fever or signs or symptoms (specifically no urinary urgency, urinary frequency, acute dysuria, suprapubic tenderness, or costovertebral angle pain or tenderness). If no catheter is in place, fever alone would not exclude ABUTI if other criteria are met
- AND**
2. A positive urine culture with no more than 2-species of microorganisms, at least one of which is a bacterium of  $\geq 10^5$  CFU/ml
- AND**
3. A positive blood culture with at least 1 matching bacteria to the urine culture

SPICE 

56

## Knowledge Check

SPICE

57

## Knowledge Check # 1

### 1 Mar.

Mrs. Ross is a resident in your facility, admitted on February 1st. An indwelling urinary catheter was inserted on March 1st.

### 5 Mar.

On March 5, the nurse practitioner documented that Mrs. Ross complained of suprapubic pain.

### 6 Mar.

The following day, on March 6, a specimen collected from the Foley catheter was sent to the lab and subsequently tested positive for greater than 100,000 CFU/ml of E. coli and 100,000 CFU/ml of Candida

SPICE

58

## Does Mr. Ross have a UTI?

- A. Yes
- B. No

SPICE 

59

## If Yes, is it catheter associate?

- A. No
- B. Yes

*What criteria are met?*

SPICE 

60

## McGeer Urinary Tract Infections

Criteria	Comments
<b>B. For the resident with an indwelling catheter</b>	
<b>Both</b> criteria 1 and 2 present	Recent catheter trauma, catheter obstruction or new onset hematuria are useful localizing signs consistent with UTI, but not necessary for diagnosis
1. At least <b>one</b> of the following sign/symptom sub-criteria (a-d) present:	
a) Fever, rigors, or new onset hypotension, with no alternate site of infection	
b) Either acute change in mental status <u>or</u> acute functional decline with no alternate diagnosis <u>and</u> Leukocytosis	
c) <b>New onset suprapubic pain</b> <u>or</u> costovertebral angle pain or tenderness ✓	Urinary catheter specimens for culture should be collected following the replacement of the catheter (if current catheter has been in place for >14 days)
d) Purulent discharge from around the catheter <u>or</u> acute pain, swelling, or tenderness of the testes, epididymis, or prostate	
2. <b>Urinary catheter culture with <math>\geq 10^5</math> cfu/ml of any organism(s)</b> ✓	

61

## NHSN Urinary Tract Infections

*For the resident with an indwelling catheter* ✓

Criteria	Comments
<u>CA-SUTI</u>	
One or more of the following (Signs and Symptoms and Laboratory and diagnostic Testing):	
a) *Fever (Single temperature $>100^{\circ}$ F or $>99^{\circ}$ F on repeated occasions OR an increase of $>2^{\circ}$ F over baseline)	
b) Rigors	
c) New onset hypotension, with no alternate site of infection	
d) New onset confusion/functional decline <b>AND</b> Leukocytosis ( $>14,000$ cells/mm <sup>3</sup> or left shift (6% or 1,500 bands/mm <sup>3</sup> ))	
e) New or marked increase in costovertebral angle pain or tenderness	
f) <b>New or marked increase in suprapubic tenderness</b> ✓	
g) Acute pain, swelling, or tenderness of the testes, epididymis, or prostate	
h) Purulent discharge from around the catheter	
	<b>AND</b>
	<b>A positive urine culture with no more than 2 species of microorganisms, at least one of which is a bacterium of <math>\geq 10^5</math> CFU/ml</b> ✓
	<i>*Fever can be used to meet CA-SUTI criteria even if the resident has another possible cause for the fever (for example, pneumonia)</i>

62

## Knowledge Check # 2

Mr. U, a resident of LTC facility has a urinary catheter in place for 3 days for acute urinary retention. Later that day he spikes a fever of 101°F and has a cough with shortness of breath.

The physician orders a urine culture, and it comes back positive with >100,000 CFU/ml of *Pseudomonas aeruginosa* and *Candida albicans*.

Upon further work, up Mr. U is determined not to have any other symptoms that meet the NHSN CA-SUTI criteria,

§ But, a chest X-ray does show infiltrates in the right upper lobe of the lung.

63

## Does Mr. U have an infection?

- A. Yes
- B. No

*What type of infection does Mr. U have?*

- 1. Pneumonia
- 2. Catheter Associated UTI
- 3. UTI but no catheter

64

## McGeer Urinary Tract Infections

Criteria	Comments
<b>B. For the resident with an indwelling catheter</b>	
<b>Both</b> criteria 1 and 2 present	Recent catheter trauma, catheter obstruction or new onset hematuria are useful localizing signs consistent with UTI, but not necessary for diagnosis
1. At least <b>one</b> of the following sign/symptom sub-criteria (a-d) present:	
a) <b>Fever</b> , rigors, or new onset hypotension, with no alternate site of infection ✓

67

## Knowledge Check # 3

Day 1: Ms. R had an indwelling urinary catheter inserted for a bladder outlet obstruction

Day 2: The indwelling urinary catheter remains in place

Day 3: The resident's indwelling urinary catheter remains in place. The resident had a single oral temp of 100.2°F. A urine culture was collected from the catheter

SPICE

68

**Ms. R continued**

Day 4: The indwelling urinary catheter remains in place. No symptoms documented

Day 5: The urine culture was positive for *Candida glabrata*  $10^5$  CFU/ml

SPICE

69

**Does Ms. R have an infection?**

A. Yes

B. No

*What type of infection does Ms. R have?*

1. Catheter Associated UTI
2. UTI but no catheter

**Which definition is met?**

1. NHSN
2. McGeer
3. Both

SPICE

70

71

## Knowledge Check # 4

Mrs. C is an 85-year-old female who is normally ambulatory, independent of ADLs and very social with staff and other residents. She has been a resident of your facility for 10 years

This morning, March 5<sup>th</sup>, Mrs. C seems confused, refuses breakfast, is incontinent of stool and does not want to get out of bed.

Vital Signs: Temp 99.5, RR 22, O<sub>2</sub>Sat 93% on room air and BP is 110/70. Urine is dark yellow and has a strong odor.

Physician orders, UC, BC and chest x-ray

SPICE

72

## Knowledge Check # 4

Diagnostic test are completed,  
and results are as follows:

UC positive for  $>10^5$  cfu/ml of  
*klebsiella pneumonia* and  $> 10^2$   
*candida albicans*

Chest x-ray negative for  
infiltrate

BC + for *Klebsiella pneumonia*

What Surveillance Definition Does Mrs.  
C meet?

1. Lower respiratory tract
2. Gastroenteritis
3. Urinary tract infection
4. Bloodstream infection
5. Asymptomatic Bacteremic  
Urinary Tract Infection

SPICE 

73

## Asymptomatic Bacteremic Urinary Tract Infection (ABUTI)

Resident with or without an indwelling urinary  
catheter:

1. **No qualifying fever or signs or symptoms** (specifically no urinary urgency, urinary frequency, acute dysuria, suprapubic tenderness, or costovertebral angle pain or tenderness). If no catheter is in place, fever alone would not exclude ABUTI if other criteria are met

**AND**

2. A **positive urine culture** with no more than 2-species of microorganisms, at least one of which is a bacterium of  $\geq 10^5$  CFU/ml

**AND**

3. A **positive blood culture with at least 1 matching bacteria** to the urine culture

# Gastrointestinal Tract Infections

Criteria	Comments
<p><b>B. <u>Norovirus gastroenteritis</u></b></p> <p>Both criteria 1 and 2 present</p> <p>1. At least one of the following GI sub-criteria</p> <ol style="list-style-type: none"> <li>Diarrhea, three or more liquid or watery stools above what is normal for the resident within a 24-hour period</li> <li>Vomiting, two or more episodes in a 24-hour period</li> </ol> <p>2. A stool specimen positive for detection of norovirus either by electron microscopy, enzyme immune assay, or by a molecular diagnostic test such as polymerase chain reaction (PCR).</p>	<p>In the absence of laboratory confirmation, an outbreak (2 or more cases occurring in a LTCF) of acute gastroenteritis due to norovirus infection in a LTCF may be assumed to be present if all of the following criteria are present ("Kaplan criteria")</p> <ol style="list-style-type: none"> <li>Vomiting in more than half of affected persons</li> <li>A mean (or median) incubation period of 24-48 hours</li> <li>A mean (or median) duration of illness of 12-60 hours</li> <li>No bacterial pathogen is identified in stool culture.</li> </ol>

83

Criteria	Comments
<p><b>C. <u>Clostridium difficile gastroenteritis</u></b></p> <p>Both criteria 1 and 2 present</p> <p>1. <b>One</b> of the following GI sub-criteria</p> <ol style="list-style-type: none"> <li>Diarrhea, three or more liquid or watery stools above what is normal for the resident within a 24-hour period</li> <li>The presence of toxic megacolon (abnormal dilation of the large bowel documented on radiology)</li> </ol> <p>2. <b>One</b> of the following diagnostic sub-criteria</p> <ol style="list-style-type: none"> <li>The stool sample yields a positive laboratory test result for <i>C. difficile</i> toxin A or B, or a toxin-producing <i>C. difficile</i> organism is identified in a stool culture or by a molecular diagnostic test such as PCR</li> <li>Pseudomembranous colitis is identified during endoscopic examination or surgery, or in histopathologic examination of a biopsy specimen.</li> </ol>	<p>A "<b>primary episode</b>" of <i>C. difficile</i> infection (CDI) is defined as one that has occurred without any previous history of CDI, or that has occurred more than 8 weeks after the onset of a previous episode of CDI.</p> <p>A "<b>recurrent episode</b>" of CDI is defined as an episode of CDI that occurs 8 weeks or less after the onset of previous episode, provided the symptoms from the earlier (previous) episode resolved</p> <p>Individuals previously infected with <i>C. difficile</i> may continue to remain colonized even after symptoms resolve</p> <p>In the setting of a GI outbreak, individuals could test positive for <i>C. difficile</i> toxin due to ongoing colonization and be co-infected with another pathogen. It is important that other surveillance criteria are used to differentiate infections in this situation.</p>

## Gastrointestinal Tract Infections

84

## CDI LabID Event (different than an infection)

- *C. difficile* positive laboratory assay, tested on a loose-unformed stool specimen, and collected while a resident is receiving care from the LTCF, and the resident has no prior *C. difficile* positive laboratory assay collected in the previous two weeks (<14 days) while receiving care from the LTCF

SPICE

85

## Why is *C. difficile* Surveillance Important?

*C. difficile* is the leading cause of acute diarrhea in nursing home residents

*C. difficile* infections contribute to approximately 14,000 deaths/year

~ 90% elderly

Prevention activities, like antimicrobial stewardship programs and hand hygiene are shown to prevent the spread of *C. difficile* and other infections

SPICE

86
